SUMMARY

AI engineer and software engineer with 8+ years building production software. I put LLMs to work inside real products and operations — vision extraction, agents, structured output, background AI jobs and integrations — and treat each model call like the rest of the code: typed, validated, costed and reviewed. I also run products of my own, and the infrastructure behind them.

EXPERIENCE

AI & software engineer

mar 2020 — now

Tracking Trade

- Built the AI support pipeline that reads context and documentation before a ticket reaches a person, cutting support tickets by 73%.
- Created a vision-extraction bot that reads title, prices, instalments and seller from product-page screenshots with Gemini Vision into JSON; its 158 per-marketplace prompt configs were drafted by Claude agents and validated by a test harness.
- Built an OCR + LLM extraction pipeline (PaddleOCR, LiteLLM) with schema validation, model fallback and per-call token and cost logging, plus an AI audit pass that re-checks prices and sellers from screenshots and writes corrections back to the database.
- Designed and run price collection of 40k+ offers per hour across 100+ marketplaces on 150+ Kubernetes pods, with anti-bot evasion and a screenshot stored as evidence per collection.
- Modelled field routing for 70+ routes as a VRPTW on Google OR-Tools, with penalties, visit priority by coordinate and real capacity limits — 30% reduction in real travel cost.
- Consolidated services into a monorepo and standardised how new projects start, automating parts of the operation that depended on someone being available.
- Joined sales calls as the person who explains the product in non-technical terms, which helped unlock large contracts with leading electronics and retail brands.

Products of my own · Apex

in parallel

In parallel

- Multi-sport training product with AI coaching, carried end to end: product, back end, front end, AI layer, infrastructure and go-to-market.
- AI layer on the Vercel AI SDK with pluggable Anthropic and OpenAI providers: Zod-validated structured output with a fix-and-retry loop, guardrails enforced in code, and plan changes applied only after the user confirms.
- Prompt caching, per-generation cost tracking in PostHog and per-plan AI quotas; 18+ background jobs on Trigger.dev, including AI drafts of blog and Instagram content that a person publishes.
- Integrations: Supabase auth and Postgres, Stripe subscriptions and webhooks, Payload CMS, Instagram Graph API; hosted on Fly.io and Vercel with AWS workers.
- ~200 people on the waitlist with no marketing spend.

Full stack

jul 2018 — feb 2020

Tracking Trade

- Moved from intern to a full-stack position in a short period.
- Took part in most of the product front: the migration from AngularJS to React and from Ionic to React Native, plus new products and market features.

Intern

apr — jun 2018

SKILLS

AI engineering	Vercel AI SDK, Anthropic Claude, OpenAI, Gemini, LiteLLM, structured output (Zod, Pydantic), vision and OCR extraction, prompt caching, evals, Claude Code
Automation and integrations	Trigger.dev, Stripe, Supabase, Instagram Graph API, Google APIs, PostHog, Selenium, Playwright
Back end and data	TypeScript, Python, NestJS, Hono, Ruby on Rails, PostgreSQL, Redis
Product and web	Next.js, React, React Native, Expo, Vite, tRPC, Drizzle
Infrastructure	Kubernetes, Fly.io, Vercel, AWS, Google Cloud, Railway, self-hosted: Proxmox, TrueNAS, UniFi

EDUCATION

BSc in Information Systems — UFPE

Technical degree in Computer Networks — ETEMAC
